Cloud Computing Fundamentals
Introduction to cloud computing and SaaS concepts

Project Description:

My contribution to this project is Module 1: Multi-Tenant Architecture & User Management. I designed the system to support multiple educational institutions using a single SaaS platform. Each institution is treated as a separate tenant with a unique Tenant ID. I implemented tenant management to ensure that each institution's users and data remain logically separated. The module also includes user registration, login, authentication, and role-based access control. Different roles such as Administrator, Instructor, and Student are provided with different access permissions. I designed the User Model to store details such as user name, email, password, role, and Tenant ID. Authentication verifies the identity of users before providing access to the system. Tenant validation ensures that users can access only their own institution's data. This module provides the secure foundation for the Course Content, Assessment, Cloud Deployment, and Subscription Billing modules. Overall, my contribution focuses on security, user management, tenant isolation, and scalable multi-tenant architecture.
